

Walking as a Tree Root

The most important location on campus, the key "organ" that connects the entire campus

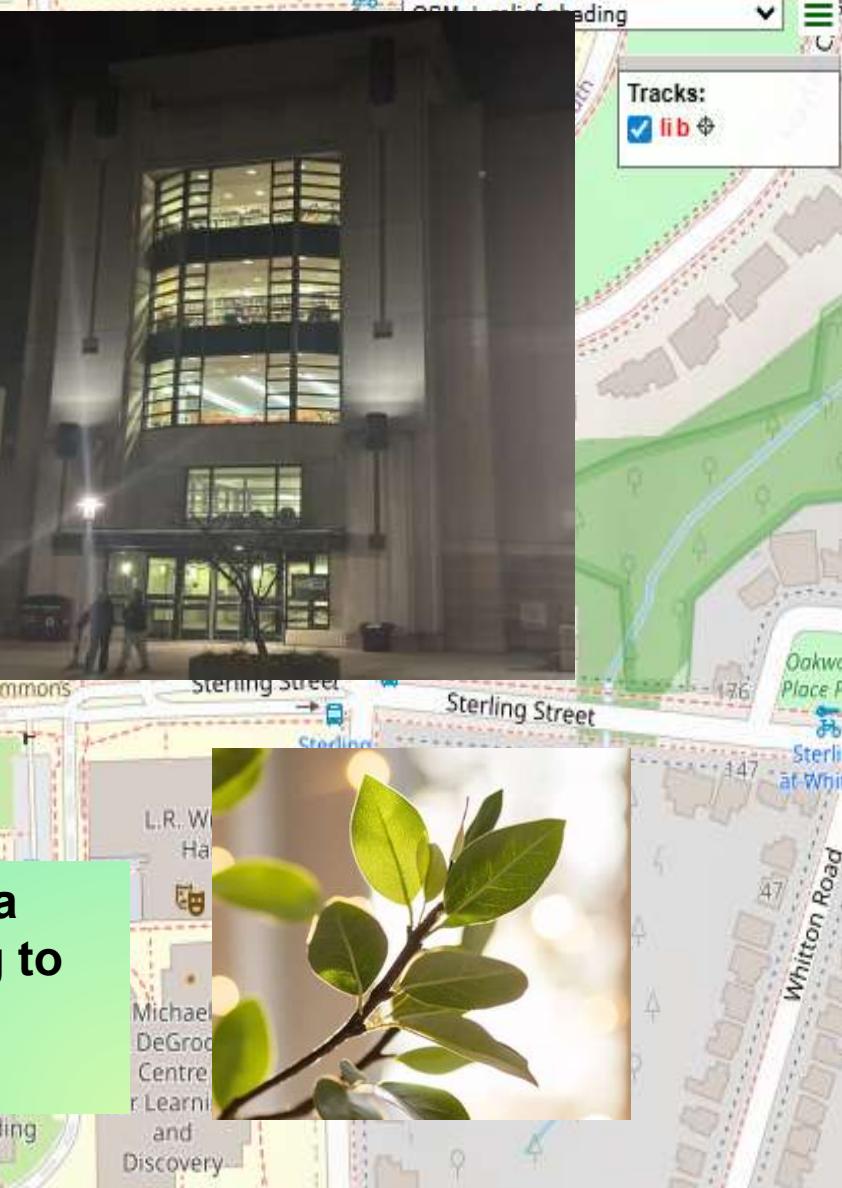

This GPS route branches like a living root system, connecting campus spaces the way trees connect through soil and leaves.

Every turn in the walk reflects a moment of attention—listening to wind, footsteps, and the quiet rhythms of campus.

Inspired by Leong et al. (2021), this project treats tracking not as surveillance, but as a relational practice between humans and the more-than-human world.

Walking becomes a form of mindful mapping, where movement reveals the hidden patterns of connection beneath everyday life.
